

## Debian Squeeze Apache/PHP/MySQL/ProFTPD build

### Installing Apache+PHP+MySQL+proftpd on Debian

1. Login to server as root. Run “aptitude install dselect” from command line. Wait for install to complete.
2. Type “dselect” in command line and press enter.
3. Go down to (S)elect on the menu and press enter. Either read the help file or press space to exit help.
4. Press '/' to do a search, and type in “apache2” and press Enter. Keep pressing 'n' on your keyboard until you see apache2 on the list, then press '+' to add to install queue, then press enter to go back to the package list. Do the same for each of the following packages - “libapache2-mod-php5, php5, php5-mysql, mysql-client, mysql-server, proftpd-basic.” Press enter when you are done to return to the main menu, select (I)nstall, and press enter. Your packages will be installed.
5. When prompted, type 'newpassword' for the mysql root password, then when prompted select standalone for proftpd.
6. Select 'Y' when prompted to remove .deb files.
7. (Q)uit dselect when you return to the main menu, and the install is complete.
8. From the command line type 'a2enmod ssl' to turn on SSL.
9. The location of configuration files for apache is under /etc/apache2, for php under /etc/php5/apache2/php.ini.
